SUMMARY

DevOps / Site Reliability Engineering focused Software Engineer with experience improving internal platforms used by 60+ engineers and building production-style Kubernetes microservices systems. Skilled in automation, observability, and cloud-native infrastructure across AWS, Docker, Kubernetes, and CI/CD.

TECHNICAL SKILLS

Languages: Python, Java, JavaScript, C++
Cloud & DevOps: AWS, Docker, Kubernetes, Helm, Terraform, Jenkins, GitHub Actions
Observability: Grafana, Prometheus, Loki, Tempo
Backend: Spring Boot, FastAPI, Flask, Node.js
Frontend: Angular, React, Next.js
Messaging: Apache Kafka, RabbitMQ
Databases: PostgreSQL, MySQL, MongoDB
Tools: Git, Linux

EXPERIENCE

Fidelity Information Services (FIS) Jan 2025 – Present
Software Engineer I – Systems Performance Engineering Chennai, India

- POC MCP-based tool over Eclipse MAT CLI enabling local JVM heap dump analysis (dominator tree, histogram, leak suspects, OQL) via natural-language tool invocation, improving root-cause debugging workflow without uploading sensitive heap dumps.
- Built a Copilot Studio-based performance intelligence agent integrated into an internal reporting tool UI to process and summarize JMeter, Dynatrace, and Grafana metrics, enabling structured performance insights and reducing manual report analysis time by 20–30 minutes per report.
- Enhanced an internal Angular + Spring Boot platform used by **60+ engineers** by resolving **10–15 defects** and delivering **3 usability improvements**.
- Delivered **2 internal technical sessions (2 hours total)** on Grafana MCP and Dynatrace MCP to **40 engineers**, demonstrating AI-assisted observability workflows.

PROJECTS

Unavu — Restaurant Catalog Platform | *Spring Boot, Microservices, Kubernetes, Helm, Grafana* GitHub

- Architected a **microservices platform (10+ services)** for social restaurant discovery across **dev, QA, and prod environments**.
- Designed and implemented a Jenkins CI/CD pipeline automating application build, test, Docker image publishing, and Kubernetes deployment workflows across the platform.
- Automated infrastructure provisioning using **Helmfile + 15 Helm charts** on Kubernetes, enabling single-command environment setup.
- Implemented full-stack observability using **Prometheus, Loki, and Tempo** for metrics, logs, and distributed tracing across all services.
- Implemented **Keycloak SSO** and an **event-driven architecture using Kafka (feed/activity) and RabbitMQ (notifications)** for scalable inter-service workflows.

Chrimata — GenAI Cost Optimizer | *Flask, React, Supabase, OpenAI, FAISS RAG* GitHub

- Developed an AI platform that generates **GenAI architectures, cost breakdowns, and ROI projections in less than 90 seconds**.
- Implemented a **FAISS-based RAG engine** indexing **30+ GenAI tools** for intelligent tool recommendations.
- Built cost modeling and ROI analytics achieving **35% projected cost savings** through optimization.
- Shortlisted among **Top 9 finalists** in the **100x Engineers Hackathon**.

EDUCATION

Vellore Institute of Technology, Chennai Oct 2021 – May 2025
B.Tech in Computer Science (Cyber Physical Systems) — CGPA: 9.06/10.00
